# Flow Monitors 1007

## Description and function

Flow units work on the suspended body measurement principle. The suspended body is introduced into a cylindrical slotted nozzle. Depending on the model, the installation of the flow monitor is either dependent of position (only with suspended bodies) or independent of position (suspended bodies with spring). A reed switch is connected external to the flow circuit. The reed switch is sealed into a freely-adjustable housing (switch housing) and is thereby protected from external influences. The incoming medium moves the suspended body in the direction of flow. If the suspended body, with its integrated magnets, reaches the position of the reed switch, the contact studs close. If the rate of flow becomes greater, the suspended body will move further in the direction of flow, with the maximum movement limited by a stop, which prevents the suspended body moving beyond the switching area of the reed switch (bistable action).

## Application

Monitoring of liquid and gaseous media, for example, in refrigeration systems and refrigeration circuits of welding machines, laser and piping systems, pumps, compressors, hydraulic systems and many more.

### Switching point and switching range

The switching point can be continuously adjusted within the switching range. At the maximum scale setting, the flow-rate can be significantly higher than shown.

### Switching hysteresis

This refers to the distance travelled by the suspended body between the switch-on and switch-off quantities. The typical hysteresis of the suspended body tube is attained by selecting reed switches with lower differences between the pick-up and drop-off activation levels (dose differential).

### Position dependence

The unit must be installed vertically, e.g. the flow must be from the bottom to the top.

### Installation in any position

By installing a spring which moves the suspended body into its initial position, any installation orientation can be used. Re-adjustment is not required, as the springs have already been artificially aged and pre-tensioned.

### Viscosity compensation

This is achieved by installing a spring connected to a perforated plate. As the spring has already been artificially aged, no readjusting is necessary.

### Maintenance

Due to its design, the flow unit requires no maintenance. Cleaning at regular intervals should only be carried out in the case of media that contains magnetic particles. These cleaning intervals can be correspondingly extended by the use of a filter with a magnetic separator.

## Assembly notices:

### 1. Units dependent of position

The flow monitor must be installed vertically in the system.

The flow must be from the bottom to the top.

### 2. Units independent of position

The flow monitor can be installed in the system in any position.

The direction of flow must be such that an increase in the flow produces a corresponding positive movement on the scale.

### 3. Viscosity compensated units

The flow monitor can be installed in the system in any position.

The direction of flow must be such that an increase in the flow produces a corresponding positive movement on the scale.

### 4. The medium must not carry any solid bodies

with it. We recommend the installation of a dirt trap of type SF, SFD or SFM.

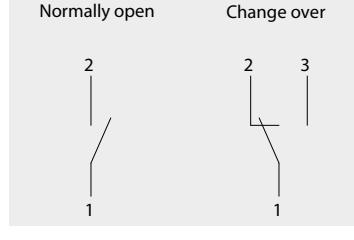

### 5. The unit with the contact device

must not be located within an induction field.

### 6. Always observe the maximum electrical values of the reed switch.

### 7. Setting the switching point:

Set the arrow on the switch housing to the desired switch-off quantity on the scale of the unit housing.

# Flow Monitors 1007

## Approvals

As an innovative manufacturer of instruments for level control, we can offer to our customers systems according to different directives. The types of approval, applications and limits of use can be taken from the following specifications.

### Approvals

#### Ex

A large number of flow monitors from our standard range, or to customer requests, can be built according to the EU-Directive 94/9/EG with the protection types EEx ia IIC T6 or EEx d T6. By the combination of the instruments with the type key, the catalogue shows with the Ex hexagonal logo which components can be used for Ex-instruments.

#### Temperature of media:

##### EEx ia-instruments

T6              75 °C

##### EEx m-instruments

T6              75 °C

### Technical data

<b>Material:</b>	Stainless steel Brass nickel-plated
<b>Operating pressure:</b>	Stainless steel to 300 bar Brass to 200 bar
<b>Operating temperature:</b>	-20 °C ... +70 °C
<b>Measuring output:</b>	4-20 mA / 15 ... 30 V DC 4-Leiter
<b>Ex - design:</b>	-
<b>Electrical connections:</b>	Patch plug, M12 x 1
<b>Linearity deviation:</b>	± 10% of final value
<b>Pressure drop:</b>	0.02 ... 0.8 bar
<b>Mounting position:</b>	Independent of position
<b>Display:</b>	Without
<b>Connection:</b>	Thread female BSP
<b>Gaskets:</b>	Perbunan Optional Viton, EPDM

## SC for air, dependent of position / vertical

Technical data		Stainless steel / Steel						
Material:	Stainless steel Steel							
Operating pressure:	Stainless steel to 40 bar Steel to 40 bar							
Operating temperature:	-20 °C ... +200 °C							
Contacts:	Change over 250 V / AC / 6 A							
Control unit:	TEH 4-wire 24 V DC / 4-20 mA TK 2-wire 24 V DC / 4-20 mA EExib							
Electrical connections:	Terminal box aluminium							
Measuring accuracy:	± 2.5 % of final value							
Pressure drop:	0.04 ... 0.22 bar							
Mounting position:	Dependent of position							
Display:	Display instrument 150x180 mm							
Connection:	Flange PN40							
Gaskets:	Viton, EPDM or Perbunan							
Protection rating:	IP65
